Vyralify — Phase 1: Complete UI/UX Blueprint

Meri recommendation hai ki Vyralify ko premium, light-themed creator operating system jaisa design karein — Stripe/Vercel-level clarity, lekin Instagram creators ke workflow ke liye custom-built.

Tumhare `Layout.pdf` ke page 1–6 wale references ko starting inspiration rakhenge, lekin unki UI copy nahi karenge. Final layout tumhari product specification ke according hoga.

1. Overall app structure

Revenue · 30d

₹24K

Engagement

5.8%

Your next best move

Review your top Reels and create a variation.

Layout concept only — illustrative sample data, not a functioning dashboard.

Exact app shell dimensions

Element	Final recommendation
Sidebar	248px expanded, 76px collapsed
Topbar	64px high
Main content	Flexible width, max-width around 1440px
Page padding	32px desktop, 24px tablet, 16px mobile

Grid gap	20–24px
Cards	12px radius, subtle border
Inputs/buttons	8px radius
Sidebar position	Fixed on desktop
Topbar position	Sticky
Main background	`#F8FAFC`
Card background	`#FFFFFF`

Important: Main workspace light grey, cards white. Isse content clear rahega aur har section ko heavy shadows ki zaroorat nahi padegi.

2. Brand design system

Typography

- Font: Inter.
- Page title: 28–32px, semibold.
- Section title: 18–20px, semibold.
- Card heading: 14–16px, medium.
- Body: 14px.
- Supporting text: 12–13px.
- Metrics: 26–32px, semibold.

Visual rules

- Icons: Lucide outline, consistent 18–20px sizing.
- Shadows: minimal, only for overlays/popovers where necessary.
- Green: primary action, selected states, meaningful positive changes.
- Red/amber: genuine errors and warnings only.
- Gradients: avoid as a default surface treatment.
- Dark mode: later, after the light system is validated.

3. Sidebar — final navigation

Navigation decision: Latest product specification mein six core modules hain, lekin Discover & Create ke andar do distinct workspaces rahenge. Isliye sidebar mein dono separately dikhana zyada usable hai.

Pasted text.txt

- Active item: soft-green background, green icon, semibold label.
- Hover: subtle grey background.
- Collapsed state: icons + tooltips.
- Automation on Free: visible locked destination with upgrade preview.
- Settings bottom mein rahega.
- No Marketplace, Brands, Clipping or Agency navigation in this build.

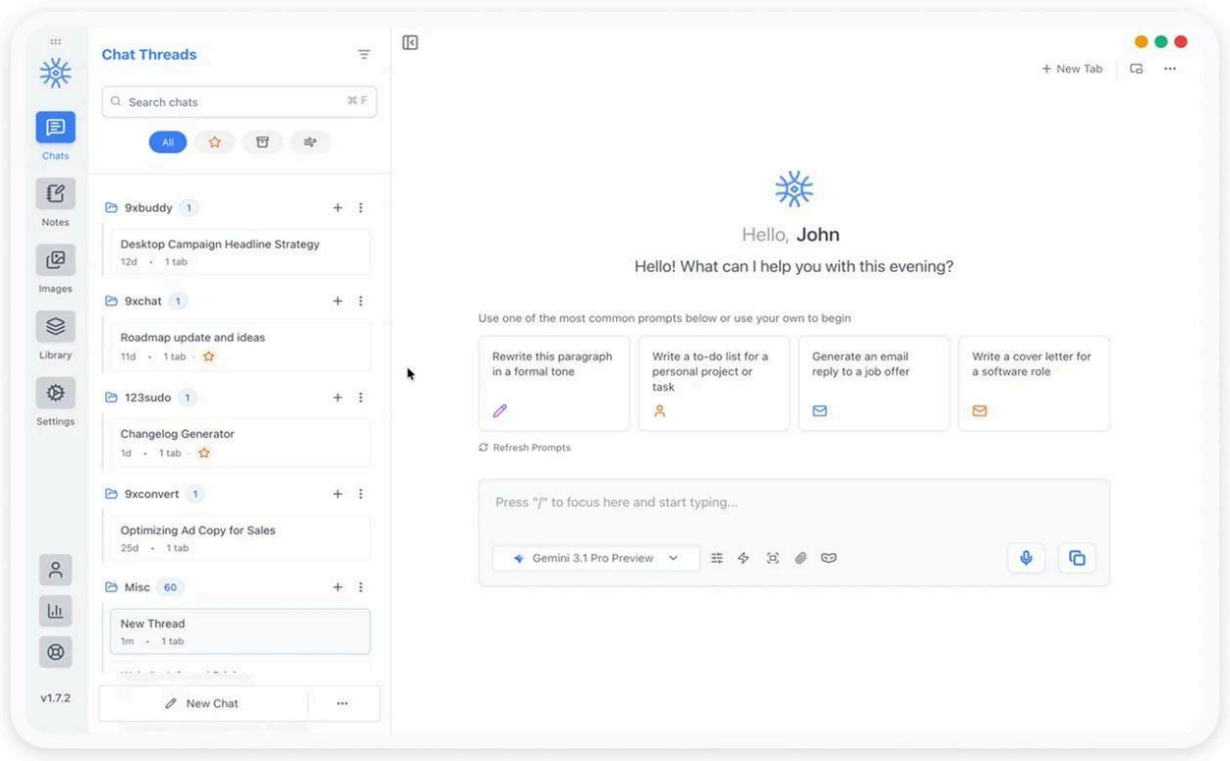

4. Har screen par exactly kya hoga?

A. Home Dashboard

Purpose: page ki health aur next action ek glance mein samajh aaye.

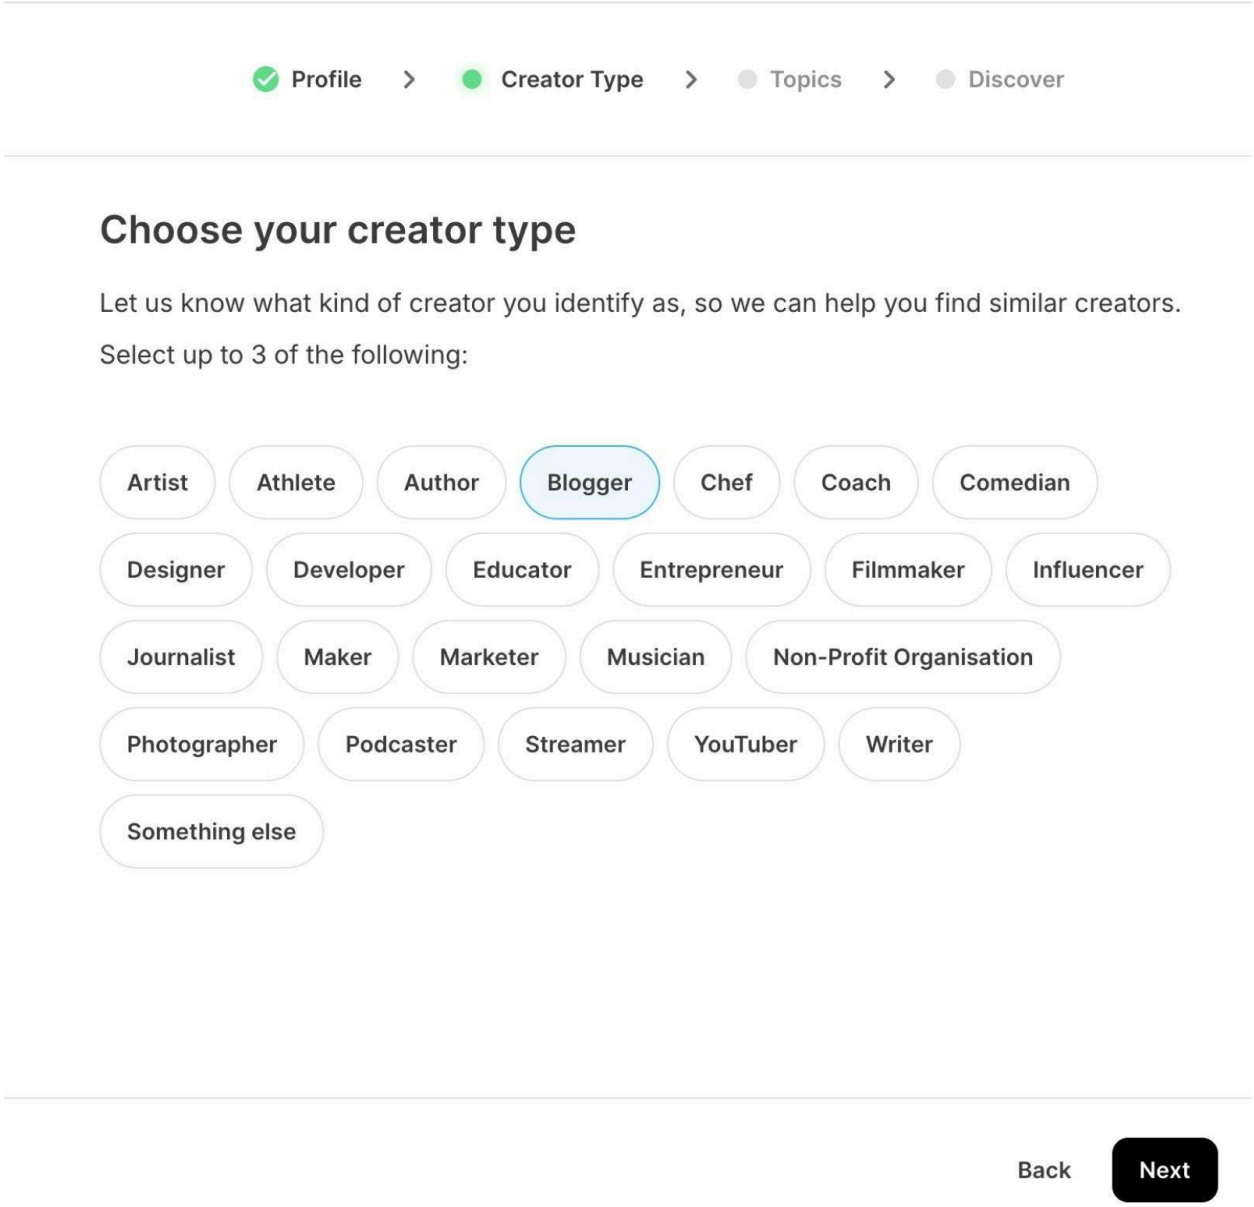

1. Page heading + active Instagram page switcher.
2. Four KPI cards: Followers, Views (7d), Revenue (30d), Engagement Rate.
3. Main performance chart with date filters.
4. Top-performing content list.
5. Revenue/sales trend and recent transactions.
6. Prominent AI Recommendations panel.
7. Quick actions: Create Content, View Store, Check Automations, Ask AI.

B. Vyralify AI

Purpose: AI sirf jawab nahi de, real data ke basis par action suggest kare.

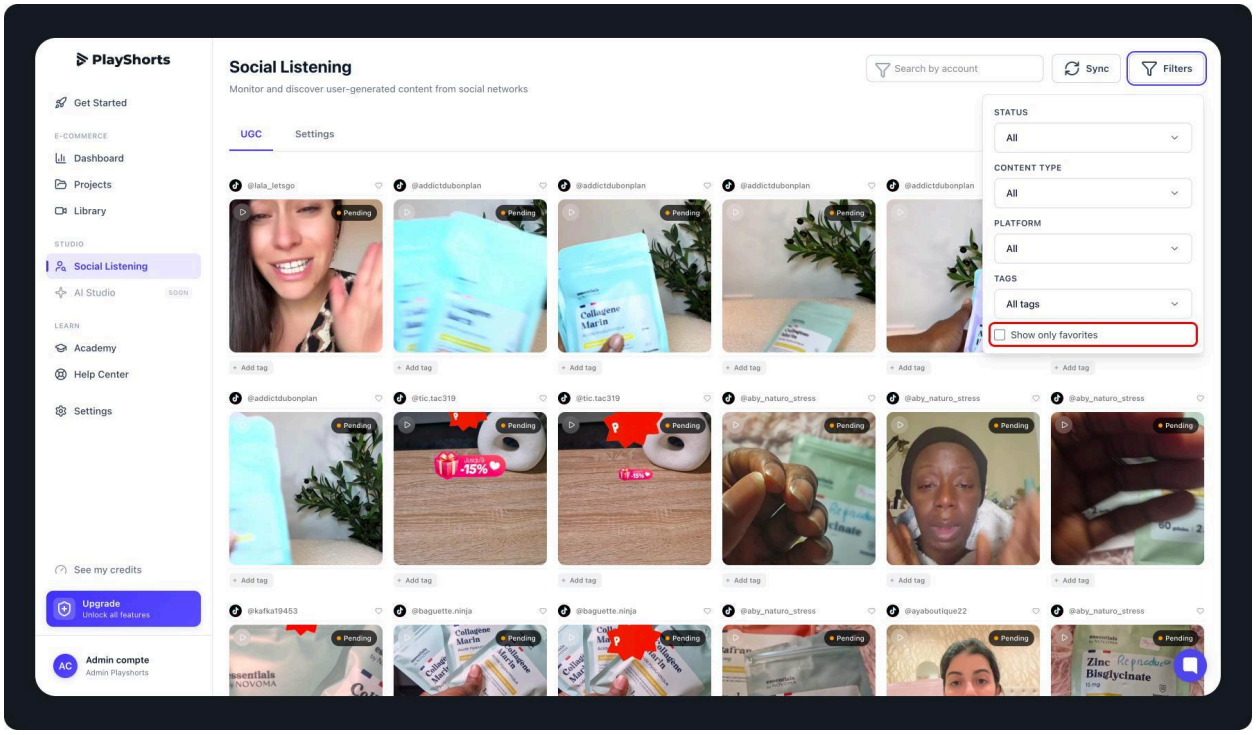

1. Conversation history in a left panel.
2. Main chat thread with readable responses.
3. Bottom composer with attachment, text input and send.
4. Suggested prompts on the empty state.
5. Context/action buttons: Create Variation, Open Discover, Review Analytics.
6. Usage indicator and clear limit warnings.
7. Error states for expired Instagram connection and failed uploads.

C. Page Builder

Purpose: beginner ko zero se guide karna, existing creator ko audit dena.

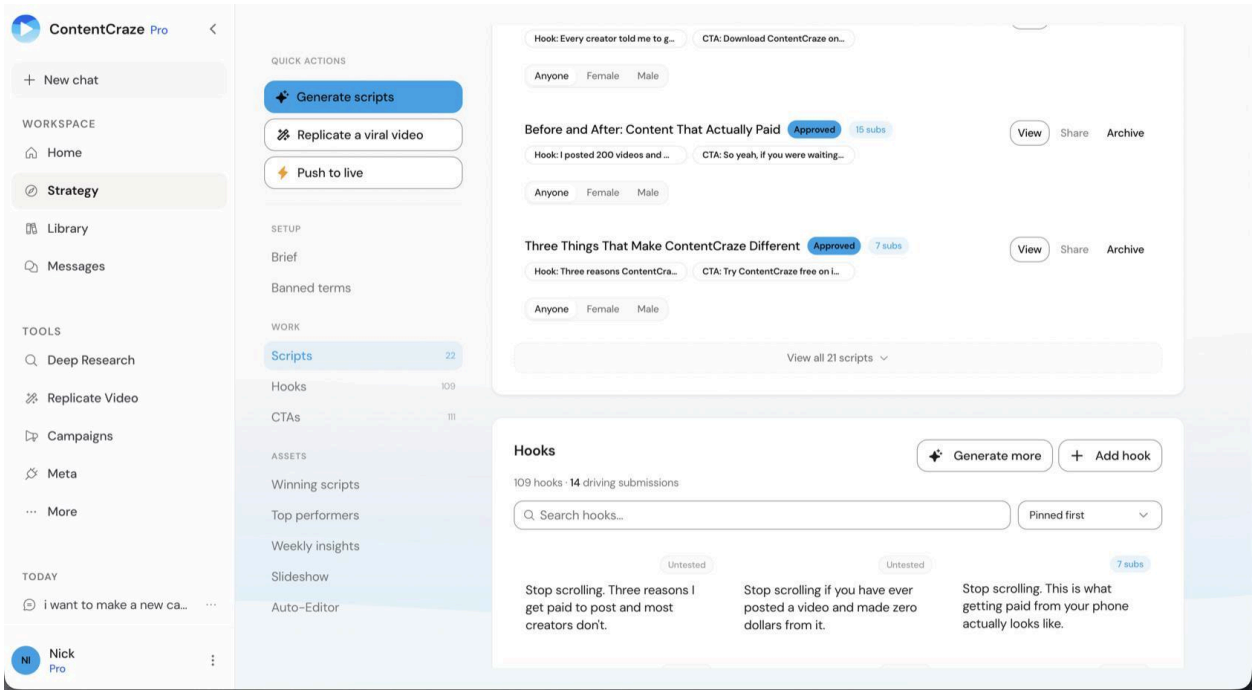

- Beginner: niche quiz → opportunity score → goals/audience → positioning → profile setup.
- Existing creator: connect Instagram → import profile/stats → audit → goals.
- Dashboard: connected pages, setup completion, audience demographics and page identity.
- Clear Add Page and Switch Page controls.

D. Discover

Purpose: find what's working in the user's niche.

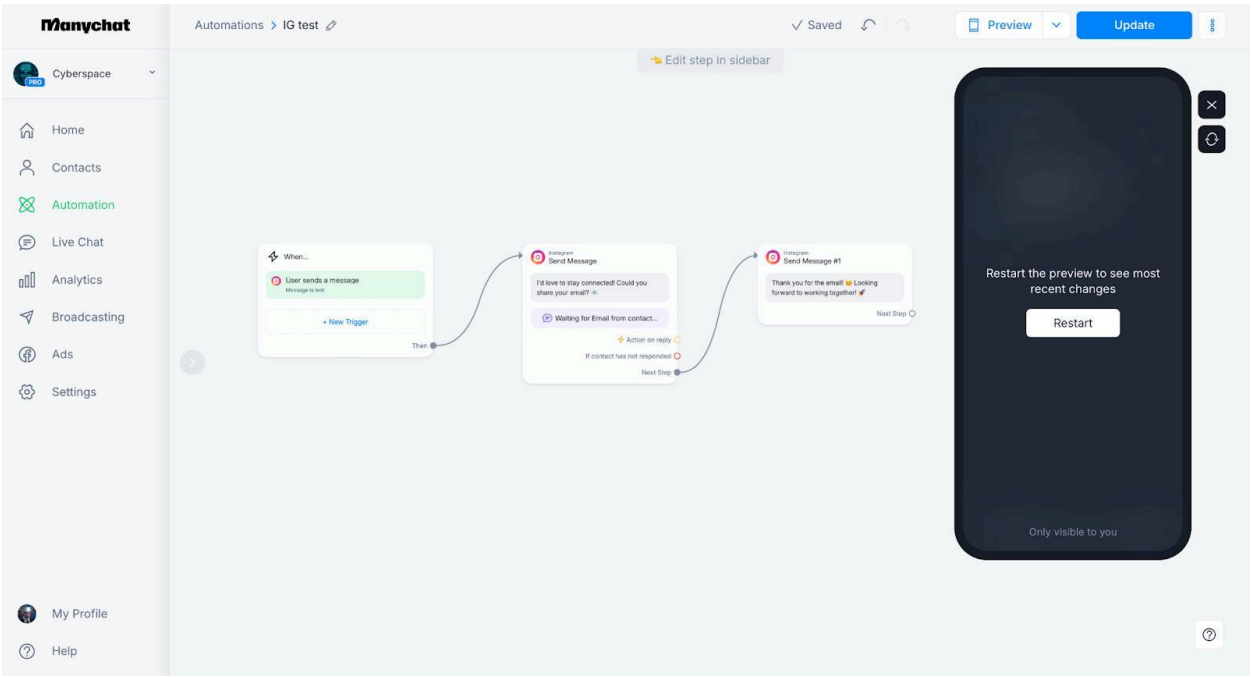

- Search and filters at the top.
- Tabs for Trending, Viral Database, Competitors and Niche Intelligence.
- Visual content grid with available performance/context data.
- Save to Research Library.
- Clear transition: Create content from a saved post.
- Broader-category fallback if niche data is sparse.

E. Create

Purpose: turn research into ready-to-use content.

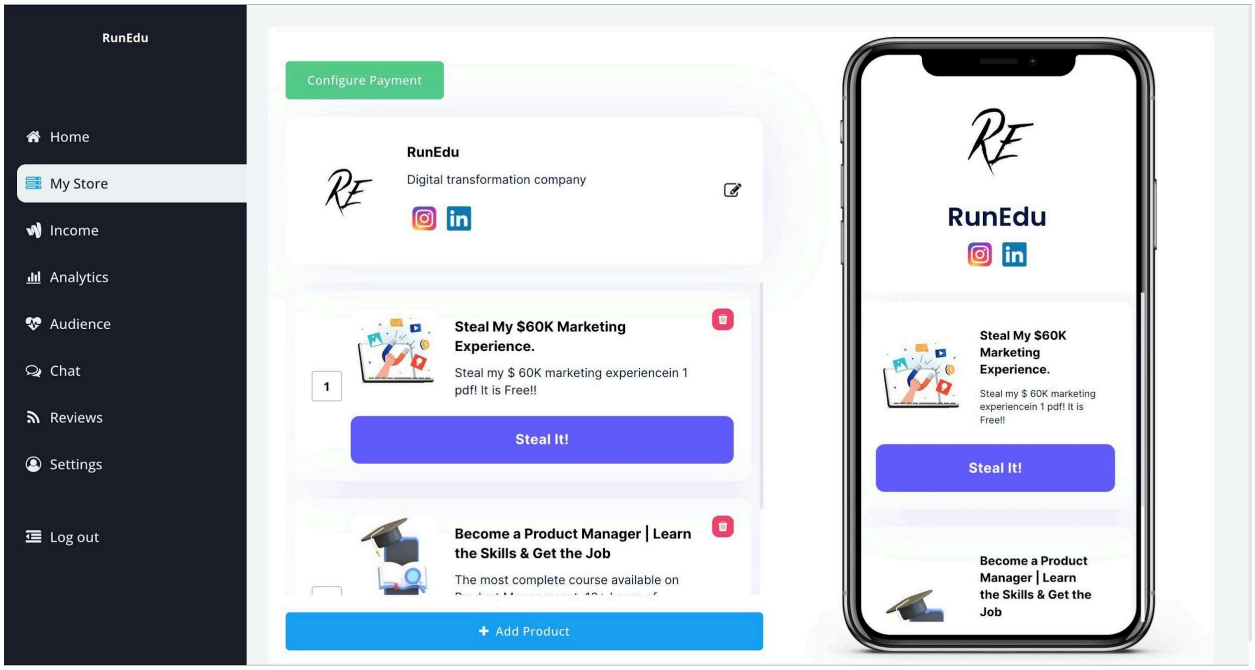

- Creation tools: Hooks, Scripts, Captions, Ideas.
- Main generation workspace with format/niche/tone controls.
- Output panel with copy, regenerate, save and edit actions.
- Calendar with day/week/month views.
- Planner, Templates and Saved Research.
- Scheduling and publishing controls based on plan and integration availability.

F. Instagram Automation

Purpose: safe workflows that convert engagement into leads or sales.

- Overview with active automations and results.
- Automation list with status, trigger and last activity.
- Builder canvas: Trigger → Conditions → Response.
- Configuration drawer and message preview.
- Test before activation, conflict warnings, activity logs.
- Pause controls and human handoff for AI conversations.

G. Store & Commerce

Purpose: creator storefront, not a complicated traditional e-commerce admin.

- Overview: revenue, orders and conversion funnel.
- Tabs: Store Builder, Products, Orders, Customers, Analytics.
- Product editor: image, title, price, description and CTA.
- Live mobile storefront preview.
- Clear payment, refund and delivery statuses.
- Winning Products Library and Elite-only white-label AI resale.

These module layouts follow the product's defined functionality; the specific visual hierarchy and dimensions are our proposed implementation decisions.

Pasted text.txt

5. Global components — ek baar design, everywhere reuse

Component	Final behaviour
Primary button	Solid green, clear verb, consistent height

Secondary button	White/neutral with border
Destructive button	Red, confirmation for consequential actions
Text input	Label above, helper/error text below
Metric card	Label, value, comparison period, optional trend
Table	Search/filter, clear empty state, row actions
Tabs	Short labels, clear selected indicator
Drawer	Secondary editing/configuration tasks
Modal	Important confirmation or short focused task
Toast	Brief success/failure feedback
Tooltip	Explain unfamiliar controls
Badge	Status only: Active, Paused, Failed, Locked
Upgrade prompt	Explain the exact limit and benefit
Skeleton	Match the final component's dimensions

Rule: Har cheez ko card ke andar mat daalna. Forms, tables, content feeds aur automation canvases ko apni natural layout milni chahiye.

6. Global topbar

Select Instagram page

Search anything...

Conceptual topbar. Search may collapse to an icon on narrower screens.

- Page switcher must update context across every module.
- Search: AI conversations, saved content/scripts, tracked competitors and store products.
- Notifications: sales, automation events, AI recommendations, billing and connection expiry.
- Help and account menus stay accessible globally.
- Avoid duplicating a page selector inside every individual module unless the workflow requires it.

7. Responsive behaviour

Desktop · 1280px+

Full sidebar, persistent topbar, 4 KPI cards, multi-column layouts, full workflow canvas.

Tablet · 768–1279px

Collapsible sidebar, 2-column metrics, compact topbar, drawers for secondary controls.

Mobile · below 768px

Sidebar becomes a navigation drawer, single-column content, 2-column KPI grid when readable, sticky primary actions.

On mobile, automation canvas can switch to a step-by-step editor instead of shrinking the full desktop canvas. Store editing should prioritise a live mobile storefront preview.

8. States we must design before launch

Every module needs the following, not just its happy path:

- First-time empty state: clear explanation + one next action.
- Loading: skeletons matching actual layout.
- No results: helpful search/filter reset.

- Error: what failed + retry or recovery.
- Disconnected Instagram: reconnect CTA and honest data freshness.
- Free-plan lock: visible preview + upgrade explanation.
- AI usage: warning at 80%, block the next request at 100% — never interrupt a response already generating.
- Success: clear confirmation and next step.
- Dangerous action: confirmation and undo/recovery where possible.

This is specifically important for the onboarding branches, plan gating, Instagram connection and automation safety described in the source specification.

Pasted text.txt

9. Accessibility and interaction standards

- Body text should remain comfortably readable; don't use tiny grey text for important information.
- Keyboard focus must be visible.
- Every icon-only button needs a label or tooltip.
- Form errors must explain how to fix the issue.
- Status must never rely on colour alone.
- Charts should include labels/tooltips and a useful text summary.
- Confirm before deleting a page, removing products with pending orders, or performing other consequential actions.
- Respect reduced-motion preferences.
- Use clear focus, hover, pressed and disabled states.

10. Technical design-system handoff

If the app is being built in React, my recommended foundation is Tailwind CSS + shadcn/ui with a custom Vyralify token layer. Reuse primitives where they save time, but customise the sidebar, content cards, charts, Discover feed, AI workspace and automation builder so the product doesn't look like a stock dashboard.

Define reusable tokens for:

- Colour
- Typography
- Spacing
- Radius
- Border
- Shadow
- Breakpoints
- Z-index/layers

- Motion
- Component heights

No need to change an existing working component library just for novelty.

11. Final Phase 1 acceptance checklist

Phase 1 completion

0/10

Colours and typography documented
App shell and sidebar dimensions defined
Topbar and global page switcher defined
Reusable components and interaction states defined
All six core modules have layout specifications
Beginner and existing-creator zero states included
Free-plan locks and upgrade prompts specified
Desktop, tablet and mobile behaviour defined
Accessibility and keyboard behaviour covered
Product scope checked against V3 specification
Proceed to Phase 2 — App Shell →

My verdict: Yeh Phase 1 ka proposed master blueprint hai. Iske baad colour/radius/spacing par baar-baar debate nahi karenge unless actual implementation mein problem aaye. Ab Phase 2 mein App Shell ko detail mein lock karenge, phir Home Dashboard.
